

**CPSC231: Computer Science II**  
**Spring 2026**  
**Participation Activity: Files + Exceptions**

**Activity 1**

Write a program that:

1. Prompts the user for the name of an input file (or takes in a command line argument input for a file name, if you are familiar with this already)
2. Opens the file (create your own input file)
3. Reads through the contents
4. Outputs the contents of the input file to an output file called "output.txt" with line numbers appended

e.g. if this is the input file:

```
hi
this
is a file
for testing
for the participation assignment
```

this should be the output file:

```
1 hi
2 this
3 is a file
4 for testing
5 for the participation assignment
```

Make sure you use the appropriate file exception handling and that your connection to your file closes every time!

**Activity 2**

Write a program that:

Swap the contents of two files. Get file names from standard input or command line arguments.

e.g.

File1.txt starts as:

```
Hello
```

File2.txt starts as:

```
Bye
```

After your program executes the files will have switched contents:

File1.txt now contains:

```
Bye
```

File2.txt now contains:

```
Hello
```
